

Compute Economy Overview

Executive Summary

The Compute Economy creates a sovereign, utility-backed token that powers machine-to-machine commerce within the REALAiD ecosystem. It solves the fragmentation in compute resource trading by providing a secure, high-velocity medium of exchange backed by real petascale compute on the SODR Ring.

The Technical Architecture

Current M2M systems suffer from high friction, lack of trust, and inefficient settlement. introduces a unified token that represents compute credits, enabling seamless trading across drones, terminals, and data centers.

Tokenomics

Metric	Details
Minting	Via verified compute contribution on SODR
Burning	Transaction fees and idle resource penalties
Utility	Redeemable for 1 hour petascale compute per

Use Cases

- Maritime: Embarkation and port logistics payments
- Robotics: Drone fleet coordination and energy trading
- Civic: Verifiable compute for public services
